

Login on Node.js App with MongoDB

Oct 12, 2017

Please jump into this task section once you've read the responsibilities mentioned in the Back-end Document.

Please send us a

- **Full Fledged Node.js App** that performs **Login Operations**.
- The App must implement **JWT web-token** to store tokens along with user model.
- A user will pass in a name and a password and should be able to get back an **authenticated token**.

TASKS

API is described below:

- Get a username & password as request parameter and return token.
- Another API which sends the token again to authenticate.

This API should accept only “token” as request parameter and send back “status” either true/false depending if token is authenticated or not.

- Once the token is generated, it must be saved with the user model MongoDB.

Once you have completed the above mentioned tasks, please send us the Github Link or the Source file in a compressed fashion.
